Notes

Given date examples in this section are in the format Day/Month/Year with 24 hour period.

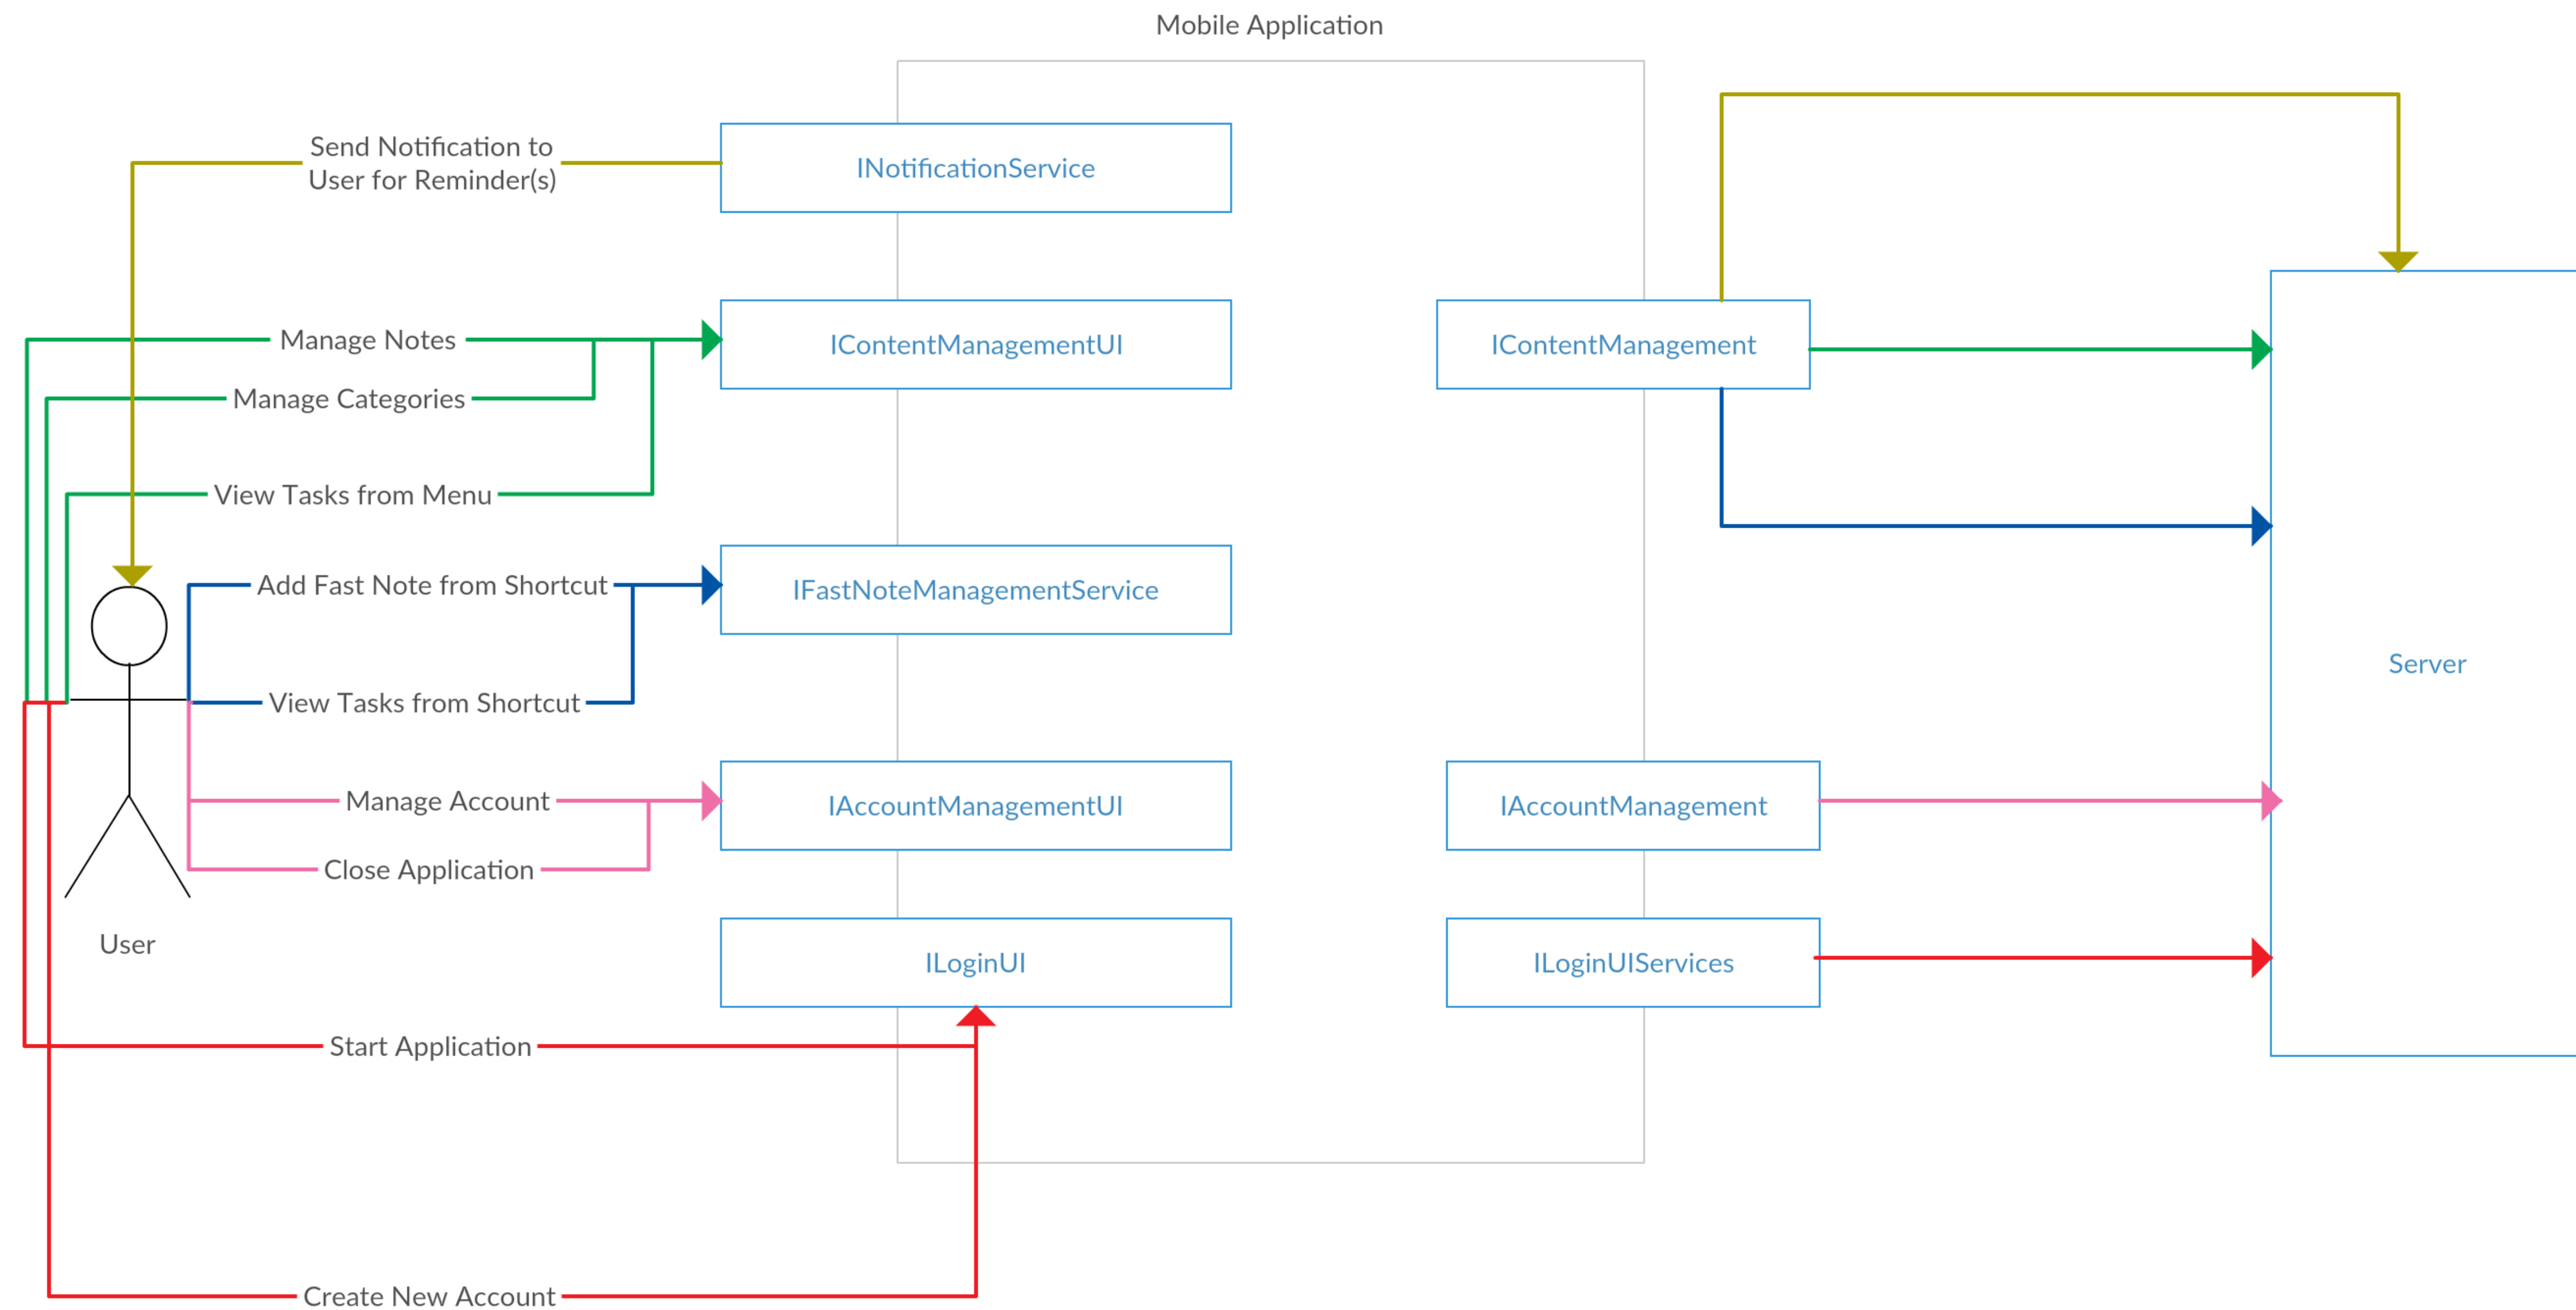

- Our design for reminders is kept very simple. Reminders just store Date object and integer named interval to be notified. For example, let's assume we have a reminder object with Date of 01/01/2017 15:00 and interval which is 3. Then, this reminder will be reminded by the system as follows:

- 04/01/2017 15:00
- 07/01/2017 15:00
- 10/01/2017 15:00

Notes:

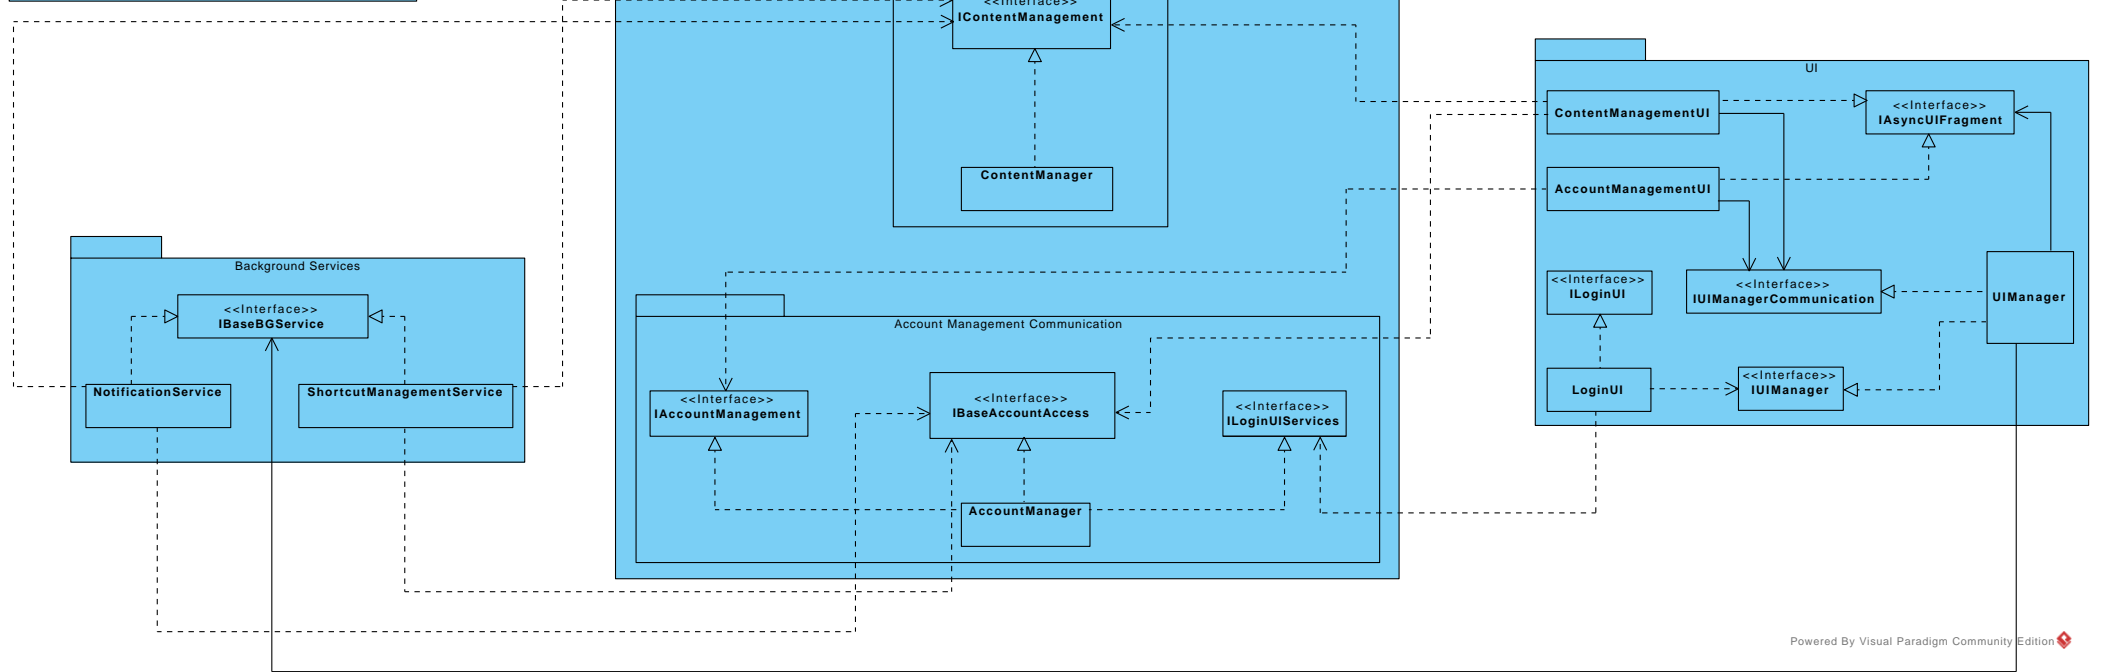

- Arrow from IFastNoteManagementService indicates notification is sent to user by system. That is, interaction is started by system. After that, user is able to interact with the notification.
- IAccountManagement and ILoginUIServices could be merged as a one interface. But, they are separate from each other because of the security reasons.
- IContentManagement, IAccountManagement and ILoginUIServices are implemented inside the mobile application and they use APIs provided on server side for use cases represented with corresponding colors.

Context (Level 0) Diagram

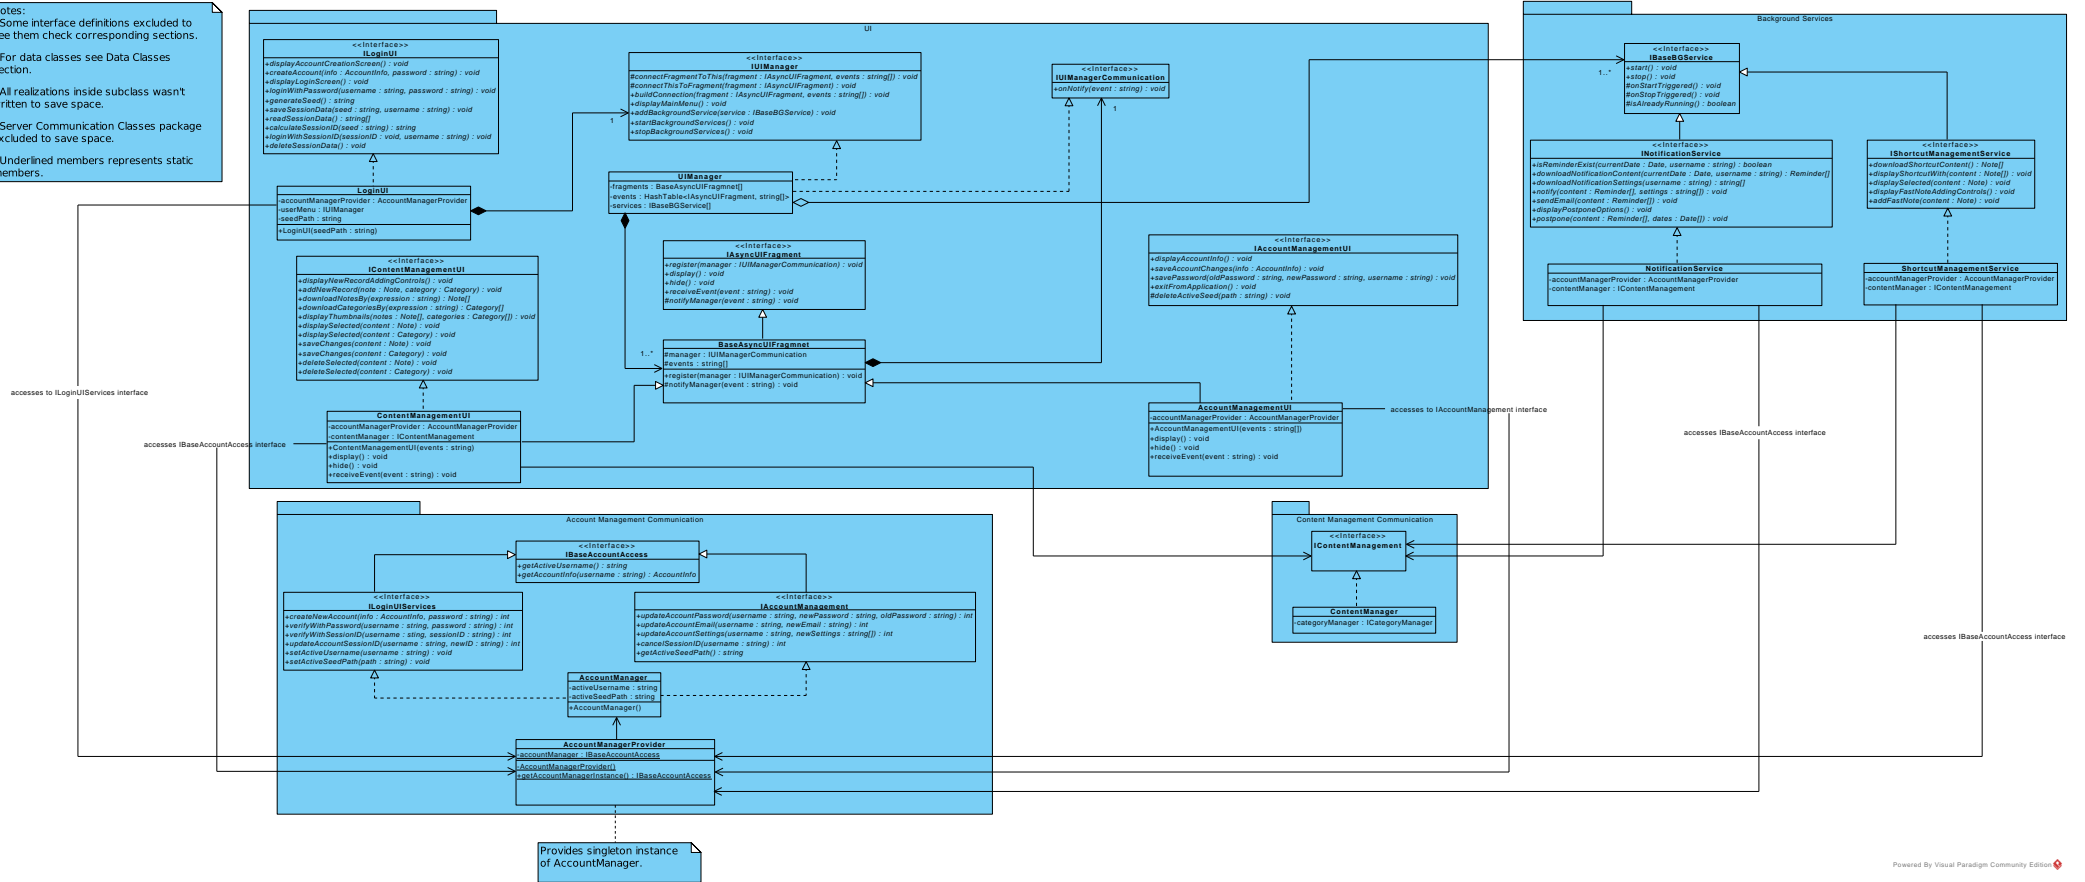

Architecture (Level 1) Diagram

- Dashed lines represent synchronous communication.
- Straight lines represent asynchronous communication.
- Directions of the arrows represent direction of the communication.

Notes:
- Some interface definitions excluded to see them check corresponding sections.
- For data classes see Data Classes section.
- All realizations inside subclass wasn't written to save space.
- Server Communication Classes package excluded to save space.
- Underlined members represents static members.

```
IContentManagement
{
    // Note management functions

    createNewNote(note : Note) : int
    searchNoteBy(expression : string) : Note[]
    updateNoteContent(target : Note, newContent : string) : int
    updateNoteCategory(target : Note, newCategory : string) : int

    createNewReminder(reminder : Reminder) : int
    searchReminderBy(expression : string) : Reminder[]
    updateReminderDate(target : Reminder, newDate : Date) : int
    updateReminderInterval(target : Reminder) : int

    sendEmailFor(reminders : Reminder[]) : int

    deleteNote(target : Note) : int

    // Category Management functions

    createNewCategory(category : Category) : int
    searchCategoryBy(title : string, owner : string) : Category[]

    updateCategoryTitle(newTitle : string, oldTitle : string, owner : string) : int
    updateCategoryColor(newColor : string, title : string, owner : string) : int
    deleteCategory(title : string, owner : string) : int
}
```

Use Case	LoginUI	UIManager	AccountManagementUI	AccountManager	AccountManagerProvider	ContentManagementUI	ContentManager	NotificationService	ShortcutManagementService
Manage Notes		onNotify()		getActiveUsername()	getAccountManagerInstance()	display() notifyManager() displayNewRecordAddingControls() addNewRecord() downloadNotesBy() downloadCategoriesBy() displayThumbnails() displaySelected(: Note) saveChanges(: Note) deleteSelected(: Note)	createNewNote() searchNoteBy() updateNoteContent() updateNoteCategory() createNewReminder() searchReminderBy() updateReminderDate() updateReminderInterval() deleteNote() createNewCategory() searchCategoryBy() deleteCategory()		
Manage Categories		onNotify()		getActiveUsername()	getAccountManagerInstance()	display() notifyManager() displayNewRecordAddingControls() addNewRecord() downloadCategoriesBy() displayThumbnails() displaySelected(: Category) saveChanges(: Category) deleteSelected(: Category)	createNewCategory() searchCategoryBy() updateCategoryTitle() updateCategoryColor() deleteCategory()		
Manage Fast Notes				getActiveUsername()	getAccountManagerInstance()		createNewNote() searchNoteBy() searchReminderBy()		downloadShortcutContent() displayShortcutWith() displaySelected() displayFastNoteAddingControls() addFastNote()
Manage Account		onNotify()	display() notifyManager() displayAccountInfo() saveAccountChanges() savePassword()	getActiveUsername() getAccountInfo() updateAccountPassword() updateAccountEmail() updateAccountSettings()	getAccountManagerInstance()				

Close Application		onNotify() stopBackgroundServices()	display() notifyManager() exitFromApplication() deleteActiveSeed()	getActiveUsername() cancelSessionID() getActiveSeedPath()	getAccountManagerInstance()			stop() onStopTriggered()	stop() onStopTriggered()
Start Application	displayLoginScreen() loginWithPassword() generateSeed() saveSessionData() readSessionData() calculateSessionID() loginWithSessionID() deleteSessionData()	connectFragmentToThis() connectThisToFragment() buildConnection() displayMainMenu() addBackgroundService() startBackgroundServices()		verifyWithPassword() verifyWithSessionID() updateAccountSessionID() setActiveUsername() setActiveSeedPath()	getAccountManagerInstance()			start() onStartTriggered() isAlreadyRunning()	start() onStartTriggered() isAlreadyRunning()
Create New Account	displayAccountCreationScreen() createAccount() displayLoginScreen()			createNewAccount()	getAccountManagerInstance()				
Send Notification to User for Reminder(s)				getActiveUsername() getAccountInfo()	getAccountManagerInstance()		updateReminderDate()	isReminderExist() downloadNotificationContent() downloadNotificationSettings() notify() sendEmail() displayPostponeOptions() postpone()	

Notes:
All functions' return type and arguments are excluded for saving space. To see them in detail, please check the class diagram and interface definitions section.
Overridden functions given with their arguments.

UIManager.hide() and Ulmanager.receiveEvent() are not included in this chart because they will be triggered by unexpected behaviours of the user. That is why they are rarely executed. Also, developer will benefit from these functions by implementing them according to his/her needs.

View Tasks from Menu is merged with Manage Notes.
Add Fast Note from Shortcut and View Tasks from Shortcut are merged to Manage Fast Notes.

Author: Deniz Yilmazok
Use Case: Start Application

Note: startBackgroundServices() is an asynchronous call. And, how startBackgroundServices() will be implemented left to developer. He/she will implement asynchronous communication by using IBaseBGService interface.

- All other function calls except startBackgroundServices() are synchronous.
